

# STILE EDGE

## Tile edging

### Half Bull-nose

Simple round edge profile which suits just about any application. Economical and quick to manufacture, it is by far our most popular edging. Pool builders and designers love it, it's perfect for stair nosing, skirting tiles and pool edging.

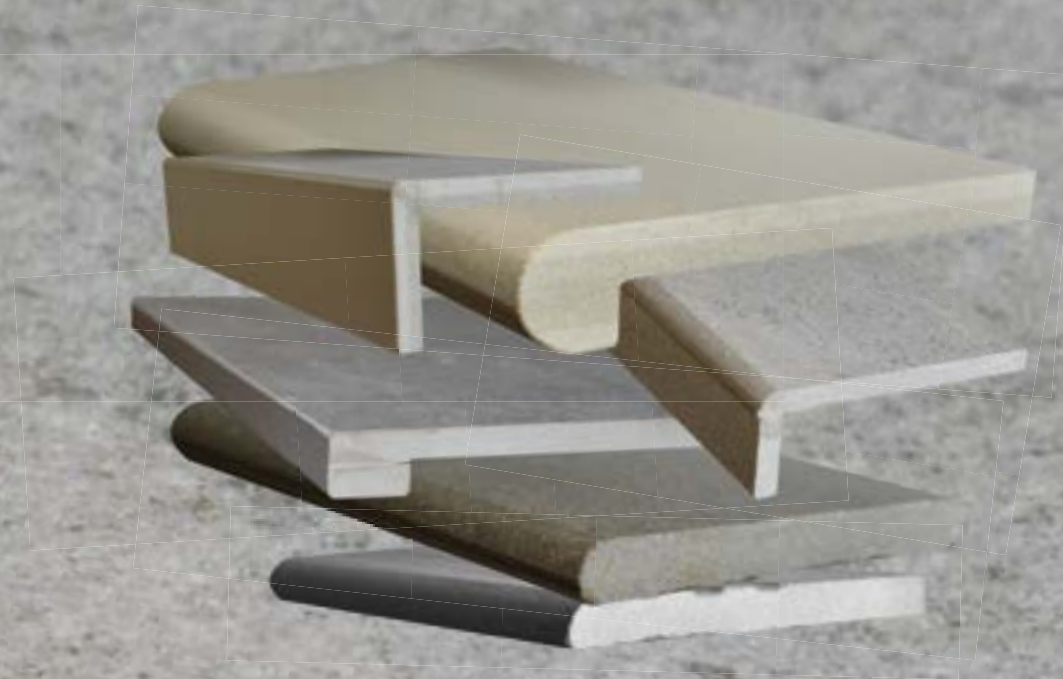

### Laminated Full Bull-nose

A chunkier, traditional profile for those who prefer a thicker and more prominent style. As with all of our laminated products, a strip of the same tile is bonded to the underside of the tile edge, then bull-nosed with either a honed or polished finish.

### Full Bull-nose

If your theme is uncluttered and minimalist, then this may be the profile for you. This neat, fully rounded edge is designed to both soften the tile edge and also give the option of creating a small overhang to add a simple but effective feature.

## The Stile Edge Concept

We are able to take virtually any tile of your choice and profile the edge to transform it into beautiful pool coping, stair nosing, skirting or border tile to provide the perfect finishing touch to your project.

### Tile Edging

Having your tiles edged eliminates the need for any other 'Add On' forms of edging which have the potential to fall off or deteriorate from continuous foot traffic with the passing of time.

### All Types of Tiles

Any type of tile that is suitable as a flooring tile may be edge profiled. Including full bodied porcelain, glazed porcelain, double loaded ceramic and natural stone tiles.

### Step Tread Grooves

6mm wide grooves are professionally cut into the tile itself, giving a perfect non-slip stair nosing without having to add any other product to your tiled stairs. Three, four or five grooves can be applied to any of your selected tiles. Step tread grooves can be used in conjunction with any of our other edge profiles.

### Flat Edge Bevel

### Laminated Flat Edge

The laminated flat edge provides a modern, square look and is most commonly used for pool coping and stair treads. A strip of the same tile is bonded to the underside of the tile to give it double thickness. The front face is machined to a perfectly flat finish and a small arris is cut along the top and bottom edges for a soft, safe finish.

### Apron with Round Edge

The apron with round edge is designed to give your coping a full bodied look with a matching tile band. Construction involves bonding a strip of the tile (usually 30-90mm height) at right angles onto the floor tile which has been machined with our very popular half bull-nose round edge.

### Mitred Edge

Our mitred edges provide an accurate, clean cut finish for when two tiled surfaces need to meet at a right angle. Our perfectly machined mitres will eliminate the slow and tedious process of hand mitring by trades people on site. Each piece is cut at a perfect 45 degree angle and are guaranteed to be free of chips and rough edges.
